C0. Introduction

(C0.1) Give a general description and introduction to your organization.

The Bridgestone Group, headquartered in Tokyo, is the world's largest tire and rubber company. In addition to tires for use in a wide variety of applications, it also manufactures a broad range of diversified products, which include industrial rubber and chemical products and sporting goods. Its products are sold in over 150 nations and territories around the world.

The Corporate Communication Division is responsible for answering the 2019 CDP questionnaire. This division coordinates and manages the Group's Environmental Mission Statement compliance, providing environmental support to business sections, Strategic Business Units (SBU) at a global level.

(C0.2) State the start and end date of the year for which you are reporting data.

<table>
<thead>
<tr>
<th>Start date</th>
<th>End date</th>

</thead>
<tbody>
<tr>
<td>Chief Executive Officer (CEO)</td>
<td>Both assessing and managing climate-related risks and opportunities</td>
<td>Quarterly</td>
</tr>
</tbody>
</table>
At Bridgestone, the CEO is the highest-level management position and has ultimate responsibility for management strategy and overall management including climate-related issues. And the highest-level committee associated with the Bridgestone Group global business execution is the Global Executive Committee (Global EXCO). Members of the Global EXCO are nominated from full-time corporate officers by the CEO/COO.

Reporting to the Global EXCO, Bridgestone has the Global CSR Enhancement Committee (GCEC) that is comprised of executive officers in charge of CSR and representatives of SBUs and functions.

Under the GCEC, Bridgestone has 7 working groups* which are related to the areas focused in our Global CSR Commitment: “Our Way to Serve”. Each working group comprised of members from corresponding functions or related areas in each SBU and report to the GCEC. Among the 7 working groups, the “Environment Working Group” summarizes and reports results related to CO2 goals and management, and proposes strategies to the GCEC, taking into account the latest social trends that might represent environmental risks/opportunities.

According to deliverables from the working groups including that from the Environment Working Group as written above, the GCEC prioritizes CSR initiatives in areas pertaining to a variety of global issues including climate change, formulates global CSR strategies and tracks the progress of activities in each area. Then, the GCEC reports to the Global EXCO and ask them for decision making on important issues.

As for risk management/assessment, the Bridgestone Group broadly divides risks into two categories: business strategic risks, which are related to management decision-making, and operational risks, which include climate change risks and are related to daily operations. The former is handled through business operations, while the latter is handled by the Chief Risk Officer (CRO), who has overall responsibility for managing risks and reports to the CEO.

*7 working groups under the GCEC: “Mobility”, “People”, “Environment”, “Compliance, Fair Competition”, “BCP, Risk Management”, “Human Rights, Labor Practices” and “Procurement”

(C1.3) Do you provide incentives for the management of climate-related issues, including the attainment of targets?

Yes
(C1.3a) Provide further details on the incentives provided for the management of climate-related issues (do not include the names of individuals).

Who is entitled to benefit from these incentives?
All employees

Types of incentives
Monetary reward

Activity incentivized
Emissions reduction project

Comment
At Bridgestone, business, departments and individuals who have made outstanding achievements, including various climate change mitigation actions and results, such as achieving a CO2 reduction target, reducing energy use, and improving efficiency or reducing waste among others can be recognized by the Representative Executive Officers in a company-wide event held on March 1, the foundation day, and also can be recognized every year by the head of the worksite in a regional event. Bridgestone’s commemorates its history and philosophy at its foundation day while reconfirming the direction the company will take in the future. This event aims to raise employees’ awareness of corporate activities. A monetary recognition as well as a regional recognition is in place.

Who is entitled to benefit from these incentives?
All employees

Types of incentives
Recognition (non-monetary)

Activity incentivized
Environmental criteria included in purchases

Comment
The Bridgestone Group Awards is the highest global recognition program for all employees that rewards efforts of organizations and individuals in five award categories. One of award categories, Environment, recognizes efforts related to climate change, such as achieving a CO2 reduction target, reducing energy use, and improving efficiency or reducing waste. This award program, raises awareness among employees and encourages their participation in environmental activities. Group Award winners are honored each year during a ceremony held at Group headquarters in Tokyo. In 2019 the Group awarded the launch of 3 global policies including the Global Sustainable Procurement Policy (presented in 2018) . This new procurement policy focuses on supplier’s sustainable procurement practices that incorporate environmentally responsible measures for climate change, reduction of Green House Gas (GHG) emissions as well as the use of energy as one of four major areas.

(C2.2b) Provide further details on your organization’s process(es) for identifying and assessing climate-related risks.

1. Risk Assessment Structure in the Bridgestone Group

The Bridgestone Group broadly divides risks into two categories: business strategic risks, which are related to management decision-making, and operational risks, which include climate change risks and are related to daily operations. The former is handled through business operations, while the latter is handled by the Chief Risk Officer (CRO), who has overall responsibility for managing risks and reports to the CEO. The Group promotes risk assessment as a part of comprehensive activities to appropriately manage risks common to the operations, with consideration for the scale and characteristics of each site and Group company and without limitation of time period (six years or more). Through the dual promotion of the Group's global unified activities and autonomous risk management activities by branches, important risks common to the Group (Corporate risk, managing process of which is reported to the CRO once every half a year) and risks of each site and Group company (Asset risk, countermeasures and yearly self assessment of which are considered and conducted by each facility) are identified.

2. The process for assessing the potential size and scope of identified risks

In the Bridgestone group, both corporate and facilities conduct risk identification at least once a year, utilizing globally common direction. Then, they evaluate risks, utilizing globally unified criteria which consists of viewpoints of their impact and possibility of occurrence. The Group standardized the degree of impacts of risks by impact-type such as human life/health, financial loss, operational impact (period of suspension of sales and plant operation or time necessary for response), social trust and so on, regardless the possible timing of occurrence. The criteria to determine rank differ by the impact-type. But as for environment related risks including climate change and CO2 emission, the Group consider its possible impact is substantive when it falls under one of the following criteria: “Strong feeling of discomfort extending to areas surrounding the office/plant, accompanied by health damage in some cases, or health damage caused externally over a wide area”, “Excess limit of financial amount (determined by company)”, “Over two weeks' impact on division (period of suspension of sales and plant operation or time necessary for response)”, or “Trust damaged in terms of the company's constitution (falsified reports, organizational scandal)”. On the other hand, we also estimate possibility of occurrence and classify them into 4 ranks based on the likelihood.

3. How climate-related risks are identified and assessed at a company/asset level

As the result of the evaluation based on impact and possibility of occurrence, the risks “with a high possibility of occurring and major impact” and “with a significant impact of it should occur, although its possibility is low” are considered “Significant risk” and classified into “Corporate risk”. And others are into “Asset Risk”.

4. The process to determine the relative significance of climate-related risks in relation to other risks

The process for risk identification and assessment mentioned above is also applied to the risks other than environment related ones including climate change, so various risks which we may face can be assessed in comparable manner.

CDP
5. The definitions of risk terminologies used and references to existing risk classification frameworks

Bridgestone’s definition of “risk” is events (incidents, accidents, natural disasters or problems, etc.) that may cause damage to organizations, employees, products and services, financial conditions, brands, customers, shareholders, business partners or neighbors. In addition, Bridgestone promotes improvement of risk identification and management framework referring ISO 31000, the international standard for risk management.

6. Definition of substantive financial or strategic impact on the business

Through the process written above, we figure out substantive risks. From financial perspective, the threshold for the judgement is whether the risk is anticipated to cause more financial loss than a standardized amount. And also, from strategic point of view, the standardized degree determined by impact-type such as human life/health, financial loss, operational impact (period of suspension of sales and plant operation or time necessary for response), social trust and so on is utilized to judge. The concrete criteria including the amount of financial loss is determined by each of corporate, sites and Group companies which conduct the risk assessment, with consideration for the scale and characteristics of them.
(C2.2c) Which of the following risk types are considered in your organization’s climate-related risk assessments?

<table>
<thead>
<tr>
<th>Risk Type</th>
<th>Relevance &amp; Inclusion</th>
<th>Please Explain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current regulation</td>
<td>Relevant, always included</td>
<td>Recently, various regulations have been introduced for the purpose of curbing climate change. With respect to tires also, maximum limits on rolling resistance and the labelling system have been introduced. Following such new regulations, operational cost such as to develop low rolling resistance tires, to measure rolling resistance coefficient value and to print labels has been increased. There is a possibility of further increase of operational cost in case such regulations become stricter and/or expand globally. The global Environment Working Group is monitoring social trends including current regulations and Bridgestone encourages the development and launch of low rolling resistance tires to contribute to CO2 emissions reduction activities.</td>
</tr>
<tr>
<td>Emerging regulation</td>
<td>Relevant, always included</td>
<td>There are discussions about introducing carbon pricing in many countries, and since Bridgestone has facilities in over 20 countries, there is a possibility of increasing operational cost. The global Environment Working Group is monitoring social trends including emerging regulations such as carbon tax, etc. and Bridgestone encourages activities to reduce CO2 emissions.</td>
</tr>
<tr>
<td>Technology</td>
<td>Relevant, always included</td>
<td>There is a possibility of sales decrease in case of becoming less competitive because of delay of low carbon technology development enhancing energy efficiency of products/manufacturing. By introducing such energy-efficient technologies, Bridgestone encourages providing products and services which can contribute to reduce CO2 emissions, such as fuel-efficient tires.</td>
</tr>
<tr>
<td>Legal</td>
<td>Relevant, always included</td>
<td>Bridgestone encourages ESG disclosures, however, there is a possibility of litigation claim in case of providing inaccurate information on climate-related issues such as description of energy efficiency at a tire label.</td>
</tr>
<tr>
<td>Market</td>
<td>Relevant, always included</td>
<td>Bridgestone encourages providing products and services which can contribute to reducing CO2 emissions, such as fuel-efficient tires. However, changes on climate-related requirements in the market may impact our sales. For instance, expectations for fuel efficient tires and retread tires are increasing, however, there is a possibility of losing competitiveness and drop in market share in case of delaying the development and providing tires which can improve customer satisfactions related to CO2 reductions. In addition, in case that global temperature becomes significantly higher and snowfall becomes lower, demand for winter tires might be lower. The global Environment Working Group is monitoring social trends including market requirements from customers such as automakers.</td>
</tr>
<tr>
<td>Reputation</td>
<td>Relevant, always included</td>
<td>Bridgestone encourages ESG disclosures however, there might be a potential of criticisms and drop in stock price in case of providing inaccurate information on climate-related issues. The global Environment Working Group monitors external ratings of Bridgestone by externals. The global Environment Working Group also monitors social trends including reputations of advanced companies on ESG as benchmark and criticisms for companies with ESG related misdoings to avoid future negative reputational impacts.</td>
</tr>
<tr>
<td>Acute physical</td>
<td>Relevant, always included</td>
<td>There is a risk of rubber supply shortage caused by drought or floods occurred in regions where para rubber tree grows. It can lead to lower profit because of the higher rubber procurement cost. In addition, severe weather such as floods and hurricanes could affect operations at manufacturing facilities and distribution channels. The global Environment Working Group is monitoring social trends including yearly climate change status in all regions.</td>
</tr>
<tr>
<td>Chronic physical</td>
<td>Relevant, always included</td>
<td>There is a risk of rubber supply shortage as climate pattern changes in regions where para rubber tree grows and rubber production efficiency worsen. It can lead to lower profit because of a higher rubber procurement cost. The global Environment Working Group is monitoring social trends including publications about long-term estimations related to climate-change.</td>
</tr>
<tr>
<td>Upstream</td>
<td>Relevant, always included</td>
<td>There are risks of rubber supply shortage caused by (1) drought or floods occurred in regions where para rubber tree grows (it can lead to lower profit because of a higher rubber procurement cost) and (2) climate pattern change in regions where para rubber tree grows and rubber production efficiency worsen (It can lead to lower profit because of a higher rubber procurement cost). The global Environment Working Group is monitoring social trends including yearly climate change status in all regions, publications about long-term estimations related to climate-change, movements about supplier activities for adaptation to climate risks etc.</td>
</tr>
<tr>
<td>Downstream</td>
<td>Relevant, always included</td>
<td>In Bridgestone’s value chain and business, automobile market is one of the primary fields. Therefore, Bridgestone encourages providing products and services which can contribute to reducing CO2 emissions, such as fuel-efficient tires. However, changes in market requirements may possibly impacts sales. For instance, expectations for fuel efficient tires and retread tires are increasing, however, there is a possibility of losing competitiveness and drop in market share in case of delay in developing and providing tires which can improve customer satisfactions related to CO2 reductions. The global Environment Working Group is monitoring social trends including market requirements from customers such as automakers.</td>
</tr>

</table>

1. Bridgestone’s approach to managing climate-related risks

For risk management, the Bridgestone Group broadly divides risks into two categories: business strategic risks, which are related to management decision-making, and operational risks, which include climate change risks and are related to daily operations. The former is handled through business operations, while the latter is handled by the Chief Risk Officer (CRO), who has overall responsibility for managing risks including climate change and reports to the CEO.

The Group promotes comprehensive activities to appropriately manage risks common to it, with consideration for the scale and...
Characteristics of each site and Group company and without limitation of time period, more than 6 years. Through the dual promotion of Group global unified activities and autonomous risk management activities, the Group identifies, prevents and mitigates risks, and formulate Crisis Management and Business Continuity Plans to enable appropriate support for the continuation or resumption of business.

<Process to mitigate, transfer, accept, control and/or prioritize climate-related risks>

The Group assesses risks, utilizing globally unified criteria which consists of viewpoints of their impact and possibility of occurrence then classified into "Corporate Risk" and "Asset Risk" (Detail of the methodology is written in 2.2b). As for the Corporate Risk, it discusses on and establishes action plan of measures to manage the risks from various perspective such as mitigation, transfer, accept and/or control. And the progress is reported to the CRO once every half-year period. Then the CRO deliberates the report content and as necessary, gives instructions for improvements to responsible department. As for the Asset Risk, corresponding facilities consider countermeasure and reduce impact of the risk. And they conduct self assessment of the progress per year and perform corrective actions as necessary.

2. Management processes regarding climate-related opportunities

As the first step of our managing process of climate-related opportunities, the Environmental Working Group under the GCEC comprising members from each Strategic Business Unit monitors social trends and oversees company's activities on CO2 reduction, biodiversity, resource efficiency and so on.

Based on the discussion at the Environmental Working Group level, the overall global decision-making regarding the environment, including climate change, is normally carried out by the GCEC. Members of the committee are composed of an executive officer in charge of CSR and representatives of regions and functions. As for important items, the GCEC reports them to the Global EXCO and ask them for decision on them. Then, based on the management plan finalized at Global EXCO, SBUs reflect it in each Mid-term Management Plan, prioritizing such opportunities from effect and investment viewpoints.

3. Case Study

<Physical risk>

For Bridgestone, disruption of supplies of raw material including natural rubber is regarded as one of major risks. So far, its probability of occurrence is not very high. But on the other hand, as the Group uses large quantities of natural rubber in tires and other rubber products, it estimates its potential financial impact is substantive. Therefore, the Group classifies it into Corporate Risk. From climate related viewpoint, productivity of natural rubber which is the main raw material in tires could be decreased by droughts in South East Asia as primary growing area of para rubber trees. Then, shortage and cost increase of natural rubber could adversely affect the Companies’ operating results and financial position.

As part of countermeasures, the Group is promoting various research projects aimed at practical applications for guayule, which shows promise as a new supply source for natural rubber. Aiming for practical applications in the 2020s, it will continue to strengthen various factors going forward, including improving guayule productivity through sustainable methods, establishing production processes and improving logistics.

<Transition risk>

The Group's operations around the world is subject to diverse national laws and regulations including environmental protection. It considers such Legal, regulatory and litigation risk could have potential to be one of the major risks. Labeling systems and regulations regarding tire performance like fuel efficiency are one of such risks. This risk has potential to decrease sales if investment in new technology for lower rolling resistance -which makes tires more fuel-efficient in align with other performances including cost - is unsuccessful. As the tire business is our primary business, the potential financial impact is significant. As this type of systems/regulations are expanding around the world, the probability of occurrence is relatively high. Therefore, Bridgestone regards this risk as Corporate Risk and tackle with developing tires with low rolling resistance.
C2.3

(C2.3) Have you identified any inherent climate-related risks with the potential to have a substantive financial or strategic impact on your business?
Yes

Direct operations

Risk type
Transition risk

Primary climate-related risk driver
Policy and legal: Increased pricing of GHG emissions

Type of financial impact
<Not Applicable>

Company-specific description
Introducing carbon pricing in various countries would cause increase of operational cost since Bridgestone has facilities in over 20 countries. For example, in October 2012, the Tax for Climate Change Mitigation was introduced in Japan. In response to such introduction, the Bridgestone Group is paying more taxes directly according to the use of fuel and indirectly according to the use of electricity. Specifically, by using a CO2 emissions factor of each fossil fuel, the tax rate per unit quantity (kilo litter or tonne) is set so that each tax burden is equal to 289 yen per tonne of CO2 emissions. (The tax rate was raised in three stages over three and a half years). In addition, there is a possibility of increasing payments since the Paris Agreement was ratified and there are discussions about introducing carbon pricing in Japan. For Bridgestone, it is an important climate risk to consider because approx. 30% of our manufacturing facilities are located in Japan and CO2 emission of these facilities accounts for approx. 24% of our Scope1 & Scope 2.

Time horizon
Short-term

Likelihood
Likely

Magnitude of impact
High

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
951000

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>

Explanation of financial impact figure
Current carbon tax rate in Japan is 289 yen/CO2e, however, financial impact in case of increase in tax rate can be roughly calculated as following formula. Financial impact = increase in tax rate times CO2 emission volume in Japan (about 951 thousand yen/1 yen increase in tax rate. This calculation includes impact of price increase of electricity)

Management method
In order to reduce CO2 emissions, we are promoting conversion to energy that produces little CO2 emissions and also reducing energy use itself. Energy saving initiatives at production sites is one of our primary activities. We have been implementing CO2 reduction measures such as the introduction of high efficiency equipment, installing steam turbine generators, converting to fuel emitting less CO2 and so on. In addition, in 2018, Bridgestone announced its smart factory concept with its original ICT/IoT technology. From an energy perspective, ICT named “Bridgestone Intelligent Device” conduct energy control utilizing AI one of the contribution of which is automatic optimization of manufacturing process utilizing market and development information of product. Bridgestone will introduce this new concept sequentially from 2019 including fostering at least 100 data scientists. Investments mainly for enhancing energy saving through improvements of equipment, including upgrading equipment to high efficiency equipment and converting them to inverter, at Bridgestone plants amounted to 4,079 million yen in 2018.

Cost of management
4079000000

Comment
As example of other activities, we are promoting energy saving initiatives at offices. We have reduced the number of units of equipment by promoting scrapping and integration through the visualization of the layout and utilization rate of office equipment such as printers and multifunction office equipment. We also have long succeeded in reducing power consumption by resetting illuminance by thorough measurement of lighting illuminance of business offices. We have introduced an “electric power visualization” system at the business office of Technical Center which is used to visualize the status of power consumption and verify the effects of reduction measures and to set reduction targets.

Identifier
Risk 2

Where in the value chain does the risk driver occur?
Supply chain

Risk type
Physical risk

Primary climate-related risk driver
Chronic: Changes in precipitation patterns and extreme variability in weather patterns

Type of financial impact
Increased operating costs (e.g., higher compliance costs, increased insurance premiums)

Company-specific description
Bridgestone’s main business is tires whose raw materials consist of natural rubber. Currently, natural rubber is almost entirely made from the sap (latex) of para rubber tree. 90% of the growing area of para rubber tree is in Southeast Asia and owing to droughts in the tropical rainforests of Southeast Asia caused by El Nino, the deciduous period for para rubber tree becomes longer and the period during which sap can be obtained becomes shorter, thereby leading to a decrease in yield. As a result, the balance of supply and demand is expected to be upset and the price of natural rubber, which plays a vital role as a raw material of tires, is expected to surge. If the price of natural rubber rises and it becomes difficult to procure such rubber, the cost of tire production will increase. This in turn is expected to result in lower profit or a decrease in share due to higher tire prices.

Time horizon
Medium-term

Likelihood
Likely

Magnitude of impact
Medium-high

Are you able to provide a potential financial impact figure?
Yes, a single figure estimate

Potential financial impact figure (currency)
5220000000

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>

Explanation of financial impact figure
At this moment, we are unable to accurately estimate the financial implications. However, we estimate that once this scenario takes
place, the procurement cost will increase drastically. For example, an increase of about 5.22 billion yen worldwide for every yen rise per kilogram of whole raw material for our production including natural and synthetic rubber, based on 2018 production levels.

Management method
In order to avoid the risk above, Bridgestone produces a portion of the raw materials at our own rubber tree farms, as well as establishes disease diagnostic technology and conducts research on genome decoding aimed at breed improvement. Through these efforts, we are augmenting output and preparing for the risk of being unable to procure. The Bridgestone Group owns natural rubber tree farms in Indonesia and Liberia. The entire research and development expenses of the Global Group, including measures like establishing disease diagnostic technology and conducting research on genome decoding aimed at breed improvement totaled 103.5 billion yen per year in 2018.

Cost of management
103500000000

</table>

Management method
In order to prevent decreasing in brand value, we believe that it is important to accurately disclose information on supply chain GHG. When disclosing GHG information, we deem the following 3 points crucial. 1) Guarantee of reliability of information We obtained a third-party verification of our 2018 calculation results through an external organization and disclosed it. And we utilize external evaluation schemes to secure objectivity from stakeholders’ viewpoint. As the result of such effort by 2018, We were ranked or selected to A- on CDP Climate Change, DJSI World and FTSE4Good Index Series etc. as of Feb.2019. 2) Secure
method of information disclosure We think we can meet stakeholder’s expectations by disclosing information in accordance with CDP requirements. The disclosure connected with the objective under long-term environmental vision has made our initiatives easily understandable. 3) Secure means of access to information We use our website and Global Sustainability Report to make it possible for all stakeholders to access information of our various activities. The effort to communicate with stakeholders through the Global Sustainability Report was awarded “Environmental Communication Awards 2017 Excellent prize” by the Ministry of the Environment of Japan in Feb, 2018. We spent approx. 33 million yen in 2018 in total for implementing measures above such as obtaining third-party verification of our 2018 GHG calculation results and issuing a Sustainable Report.

<Not Applicable>

Company- specific description
Recently, various regulations have been introduced to curb climate change. With respect to tires also, maximum limits on rolling resistance and the labelling system have been introduced. Although tires do not emit GHG when they are used, passenger cars and trucks emit a large volume of GHG. Improving fuel consumption, would be a countermeasure against such emissions. Although the fuel consumption of passenger cars and trucks is determined by engine performance and various resistance factors, among such factors, the impact of resistance by tire is said to be about 10-20% for passenger cars and about 20-30% for trucks, though this depends on driving conditions. Resistance by tire mentioned here is referred to as “rolling resistance” which is resistance arising when a tire rolls. In other words, the same vehicle will have better fuel consumption if the tire rolling resistance is low. As such, each country is adopting the following systems as a measure to lower rolling resistance. 1. Set a maximum value for rolling resistance and prohibit sale if this maximum value is exceeded. (Maximum limit) 2. Grade rolling resistance according to 5-7 levels and carry out labelling. For example, Europe (EU member states), South Korea, Brazil and the Middle East (GCC, Israel) have already introduced the maximum limit and labelling systems, and Japan has introduced the labelling system as a voluntary industry standard. Bridgestone considers that these systems could be a risk to decrease sales units if investment in new technology for better rolling resistance in align with other performances including price is unsuccessful. Therefore, we are developing products with better rolling resistance to prevent reduction of sales volume.

Potential financial impact figure (currency)
3051000000

Potential financial impact figure – minimum (currency)
<Not Applicable>

Potential financial impact figure – maximum (currency)
<Not Applicable>

Explanation of financial impact figure
The global tire market is valued at approximately 168 billion US dollars in 2017 (Reference: Tire Business – Global Tire Company Rankings) and is expected to grow two to three-fold by 2050. Our tire sales in 2018 was about 3,051 billion yen. When considering
the maximum limit and labelling system of rolling resistance as an risk to bring financial impact, we estimate potential financial impact to be 30.51 billion yen per 1% decreasing of annual sales. The actual value depends on the degree of sales decrease of tires not satisfying fuel efficiency level required by a future system.

Management method
The most important factor to prevent this risk is the development of technology for reducing tire-rolling resistance. To this end, we are developing technology for tires in overall focusing on the molecular structure of raw materials, weight reduction, internal structure of tires, and tire groove configuration, among other things. As example of the achievements in 2018, we successfully expand to original equipment for new vehicles of the “Large and Narrow concept tire” employing “ologic” technology. Tires with this new technology are able to realize levels of fuel efficiency that greatly exceed those of the fuel-efficient tires we have already put on the market, and as a result, this is expected to reduce CO2 and occurrence of this risk. Additionally, we have successfully developed a new polymer to bond rubber and resins at the molecular level. This new polymer, called High Strength Rubber (HSR), boasts unprecedented durability with higher crack resistance, higher abrasion resistance and tensile strength than natural rubber, which itself has higher destruction resistance than common synthetic rubber. The new material could contribute to improving fuel efficiency with its low rolling resistance thanks to lighter weight of tires accompanied by reducing material for its higher durability. We invested in development aiming to reduce rolling resistance every year. Tire’s research and development expenses, including such investments, totaled 86.7 billion yen in 2018.

Increased revenue through demand for lower emissions products and services

Company-specific description
Recently, various regulations have been introduced with the purpose of curbing climate change. With respect to tires also, maximum limits on rolling resistance and the labelling system have been introduced. Although tires do not emit GHG when they are used, passenger cars and trucks emit a large volume of GHG. Improving fuel consumption, etc. would be a countermeasure against such emissions. Although the fuel consumption of passenger cars and trucks is determined by engine performance and various resistance factors, among such factors, the impact of resistance by tire is said to be about 10-20% for passenger cars and about 20-30% for trucks, though this depends on driving conditions. The tire resistance mentioned here is referred to as “rolling resistance” which is resistance arising when a tire rolls. In other words, the same vehicle will have better fuel consumption if the tire rolling resistance is low. As such, each country is adopting the following systems as a measure to lower rolling resistance. 1. Set a maximum value for rolling resistance and prohibit sale if this maximum value is exceeded. (Maximum limit) 2. Grade rolling resistance according to 5-7 levels and carry out labelling. For example, several regions and countries such as Europe (EU member states), South Korea, Brazil and the Middle East (GCC, Israel) have already introduced the maximum limit and labelling systems,
and Japan has introduced only the labelling system as a voluntary industry standard. Bridgestone sells tires all over the world as a global leader in the industry and the portion of tires for passenger/trucks/buses which are strongly related to the systems above accounts for 71% of our revenue. Therefore, Bridgestone considers the introduction of these systems could be comparatively large opportunity to fairly disclose and appeal to consumers the maximum limit and grading of rolling resistance of our products due to its wide range of region of operation.

30510000000

**Potential financial impact figure – minimum (currency)**
<Not Applicable>

**Potential financial impact figure – maximum (currency)**
<Not Applicable>

**Explanation of financial impact figure**
The global tire market was valued at approximately 168 billion US dollars in 2017 (Reference: Tire Business – Global Tire Company Rankings) and is expected to grow two to three-fold by 2050. By considering the maximum limit and labelling system of rolling resistance as an opportunity and making use of such opportunity, there is huge financial potential. Sales of tires, including fuel-efficient tires, were about 3,051 billion yen in 2018. We estimate potential financial impact is 30.51 billion yen per 1% increasing of annual sales. Its actual value depends on percentage of sales increase by such fuel-efficient tires.

**Strategy to realize opportunity**
The most important factor in taking advantage of such systems is the development of technology to reduce tire-rolling resistance. To this end, we are developing technology for tires, focusing on the overall molecular structure of raw materials, weight reduction, internal structure of tires, and tire groove configuration, among other things. At the same time, we are implementing the sales strategy of focusing on expanding sales of “ECOPIA” tires with substantially lower rolling resistance as a global brand. We have successfully been increasing sales of “ECOPIA” brand products and will foster this brand continuously. Also, we successfully developed the “Large and Narrow concept tire” employing “ologic” technology as a new tire environmental technology. Tires with this new technology are able to realize levels of fuel efficiency that greatly exceed those of the fuel-efficient tires we have already put on the market, and as a result, this is expected to reduce CO2. In addition, we are promoting development of tires with better rolling resistance by setting a mid-term target for us to reduce 25% of rolling resistance vs 2005 until 2020. As of 2018, we achieved 21% reduction vs 2005 (improved approx.2% from 2017) which is equivalent to 13.4 million t-CO2 of our Scope3 reduction from 2005. We invested in development aiming to reduce rolling resistance every year. Tire’s research and development expenses, including such investments, totalled 86.7 billion yen in 2018.

Supply Chain

**Opportunity type**
Resilience

**Primary climate-related opportunity driver**
Resource substitutes/diversification

**Type of financial impact**
Increased reliability of supply chain and ability to operate under various conditions

**Company-specific description**
Currently, natural rubber, the main raw material of tires, is almost entirely produced from the sap of para rubber trees. 90% of growing areas of para rubber trees are in Southeast Asia and its price often fluctuates due to issues such as demand change, climate change and speculation etc. Therefore, finding a substitute for the raw material source will be one key factor to enhance competitiveness and resilience of Bridgestone's business. The Bridgestone Group proactively conducts research and production of natural rubber resources consisting of Guayule cultivated in arid climates and Russian Dandelion cultivated in temperate climates as substitutes for para rubber trees. Additionally, we have successfully developed a new polymer to bond rubber and resins at the molecular level. This new polymer, called High Strength Rubber (HSR), boasts unprecedented durability with higher crack resistance, higher abrasion resistance and tensile strength than natural rubber, which itself has higher destruction resistance than common synthetic rubber. We expect this new material would be alternative material of natural rubber and/or contribute to reducing its usage amount. Through these activities, we can use this opportunity to differentiate ourselves in terms of diversity of raw material source and cost competitiveness and supply of tires.

**Explanation of financial impact figure**
Financial impact to tire sales in case of change in Bridgestone’s share can be roughly calculated as following formula. Financial impact = Current sales divided by current share multiplied by percentage of change in share (about 210 billion yen per 1% change in share). *The calculation is based on approx. 3,051 billion yen as Bridgestone’s sales in tire business and 14.5% as Bridgestone’s share in the tire industry in 2017

**Strategy to realize opportunity**
As a means of gaining opportunities, we have been promoting research and development on alternative resources in other climatic zones aimed at easing the overconcentration of natural rubber producing areas in Southeast Asia. 1. Guayule: The Bridgestone Group conducts research and development of guayule as a new natural rubber source replacing para rubber tree to stabilize supply. As guayule grows in arid regions, unlike para rubber tree, and the rubber component contained in its tissue has similar properties to the natural rubber harvested from the para rubber tree, it is expected to be a new natural rubber source. We commenced experimental production of natural rubber harvested from guayule in 2015 and are conducting studies for its practical application in the 2020s. 2. Russian Dandelion: Russian Dandelion, a plant native to Kazakhstan and Uzbekistan, is a material for natural rubber and is cultivated in temperate zones which are completely different from the climate conditions for para rubber tree. 3. High Strength Rubber (HSR): Our new polymer to bond rubber and resins at the molecular level. It boasts unprecedented durability with higher crack resistance, higher abrasion resistance and tensile strength than natural rubber, which itself has higher destruction resistance than common synthetic rubber. The entire research and development expenses on Group/Global basis, including development of alternative resources above, totalled 103.5 billion yen per year in 2018.

Increased revenue through demand for lower emissions products and services

**Company-specific description**
Bridgestone delivers a wide range of products to customers around the world, including tires, rubber and other diversified products. We have been providing best-in-class services, sensor devices, data-driven technology and tire asset management systems as "Solution Business" that enable increased productivity for our customers. Among the customers, Commercial Fleet operators are under constant pressure to maximize their fleet performance whilst minimizing costs. Bridgestone's integrated solution offering, combining premium products, extensive services and state of the art digital platforms provide fleet customers with safer, more sustainable and economical mobility. From climate-related viewpoint, improvement of fuel efficiency brought by our solution have been contributing to CO2 reduction. In case that stricter emission control and/or carbon pricing etc. are introduced with the rise of social momentum in future, CO2 emission reduction would become more important theme for such operators. We consider it could be our business opportunity. Bridgestone has focused on this solution business in recent years by measures represented by the acquisition of Bandag in 2007, introducing “ECO Value Pack” service which bundles new tires, retread tires and tire maintenance service into a single package for transport operators and other customers. Therefore, Bridgestone would be able to grasp the expansion of solution business related opportunity comparatively easily.

**Explanation of financial impact figure**
Success of our solution business would contribute to growth of our tire business including sales increase. Financial impact to the tire sales in case of change in Bridgestone’s share can be roughly calculated as following formula. Financial impact = Current sales divided by current share multiplied by percentage of change in share (about 210 billion yen per 1 % change in share). *The calculation is based on approx. 3,051 billion yen as Bridgestone’s sales in tire business and 14.5% as Bridgestone’s share in the tire industry in 2017

**Strategy to realize opportunity**
As announced in Feb, 2019, Bridgestone recently introduced a new strategy named “Bridgestone T&DPaaS(Tire&Diversified products as a Solution)”. The “Bridgestone T&DPaaS” will sort and link digitally, all the necessary customer, products and service related info (data) and its causality obtained from our deep knowledge and insight, to our Engineering chain, Value chain and Supply chain. Combined with our “Dan-Totsu Products” and “Dan-Totsu” Service, this whole ecosystem will continuously create new values including Co-Creation with the customer, as the “Dan-Totsu” Solution. *Dan-Totsu means “the absolute and clear leader” To drive our tire solution business further, development of various technologies other than tires is necessary. Among them, for example, retread technology and business will be one of the key components. We will drive the development of retread technology to ensure durability, increase the number of times retreaded and to contribute to the lifecycle CO2 reduction of tires. Tire’s research and development expenses, including such investments, totaled 86.7 billion yen in 2018.

<table>
<thead>
<tr>
<th>Impact Description</th>
</tr>
</thead>
</table>
| **Products and services** | Impacted
| Tire industry has maximum limits on rolling resistance and the labeling system have been introduced. For Bridgestone, failing to respond to these systems could be a risk of sales decline of ECO products, however, it also could be an opportunity to increase our sales of such products by improving rolling resistance of a tire. The potential of financial impact to net sales is estimated 30.51 billion yen per 1% of our sales is increased by taking the opportunity or decreased by occurrence of the risk. Since this risk impact is big, Bridgestone provides products and services which can reduce customers’ CO2 emissions such as fuel-efficient tires, in order to take opportunities of product efficiency regulations and standards and changing consumer behavior toward low rolling resistance tires. |
| **Supply chain and/or value chain** | Impacted
| There is a risk of rubber supply shortage as climate pattern changes in regions where para rubber tree grows and rubber production efficiency worsen. It can lead to lower profit because of higher rubber procurement cost. The actual impact is estimated 5.22 billion yen worldwide for every yen rise per kilogram of whole raw material for our production including natural and synthetic rubber, based on 2018 production level. Since this risk of impact is big, Bridgestone has the Global Sustainable Procurement Policy, which include commitment driving actions to realize long-term environmental benefits, to help identify and evaluate qualified suppliers, promote best practices on our value chain, and serve as a communication and improvement tool on enhancing CSR perspective on the supply chain among the industry. |
| **Adaptation and mitigation activities** | Impacted
| There are discussions about introducing carbon pricing in many countries, and since Bridgestone has facilities in over 20 countries, there is a possibility of increasing operational cost. In Japan’s case, the actual impact is estimated 951000 yen per 1 yen increase in tax rate. Since this risk impact is not small, Bridgestone encourages energy efficient operations such as fuel conversions, LED introduction, etc. to reduce CO2 emissions. |
| **Investment in R&D** | Impacted
| By introducing new technologies Bridgestone encourages providing products and services which can contribute to reducing CO2 emissions, such as fuel-efficient tires.. There is a possibility of sales decrease in case of becoming less competitive because of a delay in technology development. Since this risk impact is big, Bridgestone invests in R&D for eco-products/services, alternative materials in case of material shortage caused from climate-change. The entire research and development expense of the Global Group totalled 103.5 billion yen per year in 2018. Among that expense, tire’s research and development expenses totalled 86.7 billion yen in 2018. |
| **Operations** | Impacted
| There is a risk of rubber supply shortage as the climate pattern changes in regions where para rubber tree grows and rubber production efficiency worsen. It can lead to lower profit because of higher rubber procurement cost. Since this risk impact is significant, Bridgestone has been promoting research and development on alternative resources in other climatic zones aimed at easing the overconcentration of natural rubber-producing areas in Southeast Asia. The entire research and development expenses on Global Group basis, including development of alternative resources such as Guayule and Russian Dandelion, totalled 103.5 billion yen per year in 2018. |

(C2.6) Describe where and how the identified risks and opportunities have been factored into your financial planning process.

<table>
<thead>
<tr>
<th>Relevance</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revenues Impacted</td>
<td>In case climate change becomes worse and/or related regulation(s) becomes stricter, sales of vehicles and demand for tires will be reduced. The potential of financial impact is estimated 30.51 billion yen per 1% of our sales is increased by taking the opportunity or decreased by occurrence of the risk.</td>
</tr>
<tr>
<td>Operating costs Impacted</td>
<td>In case of rubber supply shortage as climate pattern changes in regions where para rubber trees grow or getting rubber production efficiency worse, rubber procurement cost becomes high. The actual impact is estimated 5.22 billion yen worldwide for every yen rise per kilogram of raw material for our production including natural and synthetic rubber, based on 2018 production level. Since this risk impact is significant, Bridgestone has a Global Sustainable Procurement Policy, which include commitment driving actions to realize long-term environmental benefits, to help identify and evaluate qualified suppliers, promote best practices on our value chain, and serve as a communication and improvement tool on enhancing CSR perspective on the supply chain among the industry.</td>
</tr>
<tr>
<td>Capital expenditures/capital allocation Impacted</td>
<td>The entire research and development expense of the Global Group including costs for developing eco-related technology (i.e. developing tires with low rolling resistance), machines/equipment (i.e. tire building machine with low energy consumption) etc. totalled 103.5 billion yen per year in 2018. Among that expense, tire's research and development expenses totalled 86.7 billion yen in 2018. Expenses and investments mainly for introducing equipment for energy saving, including upgrading them, at Bridgestone plants amounted to 4,079 million yen in 2018.</td>
</tr>
<tr>
<td>Acquisitions and divestments Impacted</td>
<td>To increase sales of products including fuel efficient tires which contributes to CO2 reduction while driving in the market, expansion of sales channel could be a strong option. In 2018, Bridgestone announced the full share acquisition of the UK automotive service provider ETB - a leading service provider including tire sales in the south-west of Britain. In addition, Bridgestone has focused on the solution business, represented by the newly launched strategy named &quot;Bridgestone T&amp;DaaS (Tire &amp; Diversified products as a Solution)&quot;. Our solution business has contributed and will contribute to customer’s safety, efficiency productivity on their utilization of mobility including fuel saving by fuel efficient product, CO2 reduction of our manufacturing by retread tires. To promote this new strategy, we utilize M&amp;A if necessary. As example, Bridgestone's subsidiary Bridgestone Europe NV/SA has announced its acquisition of TomTom Telematics, a digital fleet solutions business, for a cash consideration of 910 million euro (114 billion yen) in 2019.</td>
</tr>
<tr>
<td>Access to capital Impacted</td>
<td>Good result of external evaluation against Bridgestone from ESG perspective makes Bridgestone easier or better access to capital by increasing investors' and lenders' confidence that the company's climate-related risks are appropriately assessed and managed. As of 2018, Bridgestone obtained relatively good score on some of representative index such as CDP, DJSI and these results brought us more opportunities to access to capital. A one-yen increase in the stock price per share would result in total increase of corporate value approximately 760 million yen as of December 31, 2018. It brings easier access to capital such as issuance of new shares.</td>
</tr>
<tr>
<td>Assets Impacted</td>
<td>Introducing highly efficient equipment to manufacturing facilities is one important measure for CO2 reduction and we have promoted and will promote this. As an example, in 2018 Bridgestone's Turkish affiliate BRISA (Brisa Bridgestone Sabancı Lastik Sanayi ve Ticaret A.Ş.) established a new manufacturing facility for radial tires in Aksaray Province, Turkey with an investment amounted to 300 million USD. This new plant achieved 30% energy saving and contributes to our manufacturing with less CO2 emission.</td>
</tr>
<tr>
<td>Liabilities Not yet impacted</td>
<td>Bridgestone has an option to increase corporate liabilities for introducing machines/equipment to produce eco-products or reducing resource consumption in future. Additionally, in case carbon tax/carbon pricing is newly introduced or tightened, financial impact will be realized. In that sense, it could be &quot;potential liabilities&quot;. For example, if Japan carbon tax rate increase, financial impact will be approx. 951 thousand yen/1 yen increase in the tax rate. In addition, on the Emission Trading Scheme in EU, reduction of free allowance for tire industry by transition to phase IV (from 2021-) might be financial impact for our manufacturing facilities in EU.</td>
</tr>
<tr>
<td>Other</td>
<td>Please select</td>
</tr>

C3. Business Strategy

(C3.1) Are climate-related issues integrated into your business strategy?
Yes

(C3.1a) Does your organization use climate-related scenario analysis to inform your business strategy?
Yes, qualitative

CDP
i) How the strategy has been influenced

All global decision making regarding environment, including climate change, is carried out by the Global GCEC. Members of the committee are composed of an executive officer in charge of CSR and representatives of all regions and functions. Important decisions made by GCEC are reported to the Global EXCO, Bridgestone’s body of global business execution, and based on the management plan finalized at Global EXCO, Strategic Business Units (SBUs) reflect it in each Year Mid-term Management Plan. From viewpoint of our countermeasure against climate change, Bridgestone established the “Environmental Mission Statement” to contribute in aspects of circular economy, biodiversity and low carbon society (including long-term target to reduce over 50% of our CO2 emission by 2050 and beyond), as a part of “the Bridgestone Essence framework” that is our corporate philosophy. From the viewpoint of contribution through solving climate-related issues is always incorporated into all our activities including planning and addressing of strategy.

ii) Explanation of whether business strategy links to an emissions reductions target or energy reduction target

Bridgestone business strategy links to Environmental long-term vision and mid-term target including emissions reductions target. Specifically, the long-term target is to reduce over 50% of our CO2 emission by 2050 and beyond, and the mid-term target is to reduce our CO2 emissions per sales from operations and products’ after-use by 35 percent vs 2005 by 2020. Global Environmental Working Group summarizes progress of CO2 emissions reduction target and next strategies to achieve the target and reports to GCEC. GCEC then report to Global EXCO, and Global EXCO finalizes a management plan taking into account the report.

iii) The most substantial business decisions

In Feb.2018, Bridgestone issued the Global Sustainable Procurement Policy which is available in 12 languages, implemented/governed/enforced regionally, and applicable to all purchased materials/services/all suppliers globally. Climate change is defined as one of the requirements in the policy.

Bridgestone had already announced its goal of “100% Sustainable Materials” for 2050 and beyond as its long-term environmental vision. Challenge for its achievement will not be simple, nor can Bridgestone achieve it alone, especially on issues like climate change which require cooperation on entire value chain. In such situation, this policy is established to help identify and evaluate qualified suppliers, promote best practices, and serve as a communication and improvement tool for the industry.

Bridgestone expects the policy works for such purposes and all of its Suppliers will recognize the importance of sustainable procurement and work with the company to implement appropriate practices to create value for all Stakeholders.

For reference, 98 percent (more than 1,600) of the company’s Tier 1 tire material suppliers acknowledge the policy as of March 2019.

iv) Aspects of climate change influenced the strategy (e.g. need for adaptation, regulatory changes, or opportunities to develop green business);

Need for adaptation influences Bridgestone strategy such as developing alternative material in case of material shortage caused by climate change. Opportunities to develop green business also influences strategies such as development of tires that contribute to reduction of CO2 emissions from driving an automobile (through reduced rolling and air resistance). In 2018, we succeeded developing and started to provide new ECOPIA tires which can contribute to reducing CO2 emissions from driving with other high performance such as wet and life.

v) The most important components of the short-term strategy

Bridgestone defines the short term to be affected by climate change as the period from the present up to 2020.

-Achievement of CO2 emission reduction targets throughout the whole Group, setting 2020 as the target year, with 2005 as the baseline. We back-casted and drew up these targets from long-term environmental vision, which are ideal conditions in 2050.
- Achievement in reduction of GHG emissions mainly by the improvement in production efficiency and reduction of raw material losses at plants with an eye to regulatory compliance and acquisition of emission rights
- Product development complying with product regulations and grading of each country
- Re-examination of product structure and line-up due to shifting consumer tendencies associated with climate change.
- Needs of consumers, local residents and others in regard to climate change initiatives. In particular, acceleration of development and expansion of sales of fuel-efficient tires.

vi) The most important components of the long-term strategy

Bridgestone defines the long term to be affected by climate change as the period from the present up to 2050.

- Strengthening initiatives toward establishing a more sustainable society according to the Bridgestone Group’s Environmental Mission Statement.

- As initiatives for realizing a low-carbon society, globally-agreed long-term target that contributes to reducing GHG emissions of the whole world by at least 50% in the year 2050 and beyond.

- Re-examination of production sites controlled by the changes in weather conditions and local regulations

- Development of lightweight products that consider changes in supplies and reserves of raw material resources

- Development of fuel-efficient tires for which materials are controlled at nano level

vii) How this is gaining the company strategic advantage over competitors.

Our strategic advantages over competitors are as follows.

- Research and development capabilities for raw materials such as development of biomass-derived synthetic rubber and solutions for controlling diseases and pests of rubber trees

- Strategic planning from a long-term view up to 2050 based on long-term environmental vision

- Planning and implementation of efficient and effective CO2 emission reduction measures by having own sites in the entire supply chain from in-house production sites for raw materials to production sites and sales within the Group

viii) How the Paris Agreement has influenced the business strategy

We are aware of Paris Agreement aiming to reach net zero CO2 emissions, considering necessity of revision of strategies toward long-term environmental vision. In addition, it is necessary to monitor and respond to social trend since there is a possibility of establishment of measures such as carbon tax, to achieve each country’s reduction target based on Paris Agreement.
(C3.1d) Provide details of your organization’s use of climate-related scenario analysis.

<table>
<thead>
<tr>
<th>Climate-related scenarios</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>2DS IEA 450</td>
<td>1. Purpose Extraction of climate risks to incorporate into Mid-term policy and long-term strategy 2. Time horizon We conducted scenario analysis with business projections as of 2030 because we did the analysis as a part of the study to consider mid-term target towards 2030 when is the target year of the SDGs. 3. Boundary Global tire business as our core segment 4. Scenario identification We selected 2 degree / 4 degree scenarios to clarify climate risks widely on overall aspects (including procurement, manufacturing, logistics etc. not limiting to our product/service). We consider the 2 scenarios would be appropriate representatives of contrast viewpoints of &quot;low carbon society&quot; and society where climate change actualizes due to increasing of carbon emission. 5. Methodology 1) List climate risks on the scenarios widely 2) Estimate financial impacts of the risks with the following inputs and their future prediction - Financial information (Sales, cost, operating profit, capital expenditure etc.) - Non-financial information (CO2 emission, energy consumption, material consumption, water intake etc.) - External information (Carbon price/tax, price of renewable energy, material, water etc.) 3) Evaluate importance of each risk based on the impacts and probability 6. Assumption on the analysis 1) On the 2 degree scenario, we assume that physical impact such as flood, water shortage caused by climate change won’t be significant impact driver so the risks to focus is limited to strong rise of social demand and stricter policy. 2) On the 4 degree scenario, we assume that GHG emission will be kept high due to insufficient climate policy and/or social actions. Therefore, the risks to focus are limited to physical impact caused by high temperature, flood, hurricane, drought etc. 3) On both scenarios, we assume that we won’t conduct any particular countermeasures for the climate risks. 7. Results and implications to business objectives / strategy We found the following risks are especially important for us on each scenario. &lt;2 degree scenario&gt; - Increased cost especially on manufacturing due to introduction of carbon pricing / tax globally - Increased price of natural rubber caused by stronger demand for forest protection and shortage of its supply - Increased demand for products with lower CO2 emission (brought by low rolling resistance, retread etc.) and investment on technologies to achieve it &lt;4 degree scenario&gt; - Increased price of natural rubber caused by lower yield and supply due to abnormal weather - Damage and/or interruption on operation of manufacturing sites by sever and frequent weather disasters - Reduced revenue from winter tires caused by snowfall reduction According to the analysis, not taking any action (especially on the important risks above) will end in financial impact such as increasing of cost and the impact should be managed properly. At the same time, however, this result convinced us of appropriateness of our strategy/business model for the climate risks. We have already incorporated these risks into strategy and started action to mitigate them(e.g. CO2 reduction activity with mid-term/long-term target, development and introduction of fuel efficient tires, development of alternative materials of natural rubber, introduction of the Global Procurement Policy for sustainable natural rubber etc.). As a business case, we recently announced new strategy named “Bridgestone T&amp;D PaaS” to meet revolution of mobility service. On this strategy, customers will obtain various benefits such as higher fuel-efficiency and longer life of tire through our solution. In relation to the result of the scenario analysis, these benefits will contribute to saving consumption of natural rubber and grasping growing demand for low CO2 emission product. To keep and improve adequacy of our climate-risk management, we will continue further analysis of the risks and opportunities brought by climate change.</td>

Base year emissions covered by target (metric tons CO2e)
4570763

Target year
2050

Is this a science-based target?
No, but we anticipate setting one in the next 2 years

% of target achieved
18.4

Target status
Underway

Please explain
Target of Bridgestone Long-term Vision is to contribute to globally-agreed target (over 50% reduction of CO2 emissions). The globally-agreed target currently refers to agreement of G8 in Toyako summit in 2008, to reduce at least 50% global GHG emissions.

Target reference number
Abs 2

Scope
Other, please specify (CO2 emission excess our contribution)

The second absolute target covers the CO2 emission amount by operations and products' after-use excess our contribution from avoided emissions when our customers use the tires by improving fuel efficiency of our tires.

15733000

Target year
2020

Is this a science-based target?
No, but we anticipate setting one in the next 2 years

% of target achieved
95

Target status
Underway

Please explain
The Bridgestone Group is working to achieve its mid-term targets to reduce the volume of CO2 emissions over the entire lifecycle of a tire (15,733kt-CO2 in 2005). Considering the value when CO2 emissions from operations and products' after-use are offset by contribution of CO2 reduction at usage stage, the reduction in 2018 was 95% (compared to 2005). We are continuing activities with a dual approach aimed at achieving that contribution to CO2 reduction during use exceeds CO2 emissions from our operations and products' after-use by 2020.
(C4.1b) Provide details of your emissions intensity target(s) and progress made against those target(s).

Target reference number
Int 1

Scope
Other, please specify (Scope 1+2+3)

The target covers Scope 1+2 (Market-based method + location-based method) + 3 Purchased goods & services, Upstream transportation & distribution, Downstream transportation and distribution, End-of-life treatment of sold products, Upstream leased assets.

Target year
2020

Is this a science-based target?
No, but we anticipate setting one in the next 2 years

% of target achieved
95.5

Target status
Underway

Please explain
Focusing on the lifecycle of the Group’s products, we are working to reduce sales intensity of CO2 emitted in the manufacturing process from raw material procurement to production, logistics, and products’ after-use. CO2 intensity of the base year is 585 tCO2/hundred million yen. Individual targets/measures are considered by each business division for achieving our overall objective, and progress is being made toward the objective. The results thereof are compiled at the Corporate Communication Division and the status of objective achievement is reviewed at Global EXCO.

**Target Status**
New

**Please explain**
*The number (98%) filled in "% achieved in reporting year" is as of Mar.2019 and result of the company’s Tier 1 tire material suppliers In Feb. 2018, Bridgestone Group introduced a new Global Sustainable Procurement Policy, which reflects our commitment to creating a thriving and sustainable supply chain including natural rubber. This new procurement policy focuses on Sustainable Procurement Practices incorporating environmentally responsible procurement including measures for climate change, reduction of GHG emission as well as the use of energy as one of four major areas. As an immediate first step, Bridgestone will prioritize working closely with its employees, suppliers and customers and other industry experts to implement the policy. Over the next 18 months, Bridgestone will work with its suppliers and partners to ensure that they have received the policy and understand it. Following acknowledgment of the policy, suppliers will then work with a third-party assessment.

**Part of emissions target**
No

**Is this target part of an overarching initiative?**
No, it's not part of an overarching initiative

---

(C4.3) Did you have emissions reduction initiatives that were active within the reporting year? Note that this can include those in the planning and/or implementation phases.

Yes
(C4.3a) Identify the total number of initiatives at each stage of development, and for those in the implementation stages, the estimated CO2e savings.

<table>
<thead>

C4.3c

(C4.3c) What methods do you use to drive investment in emissions reduction activities?

<table>
<thead>
<tr>
<th>Method</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other</td>
<td>Relevant divisions report the emission costs and reduction benefits of CO2-related measures in the budgetary discussions, and investment decisions on capital expenditure are made for overall optimization. Management examines the business plans in the yearly mid-term plan, but carefully reviews investment projects based on Investment Profit Criteria taking into account the CO2 emission costs and reduction benefits as the criteria at that time. Based on the EUA price, CO2 emissions are converted into monetary value and incorporated into the Investment Profit Criteria using the Discounted Cash Flow method and used as one of the indexes for investment decisions. Both aspects of cost increase and decrease resulting from CO2 emission increase/decrease are considered for decision making.</td>

C4.5

(C4.5) Do you classify any of your existing goods and/or services as low-carbon products or do they enable a third party to avoid GHG emissions?
Yes

C4.5a
(C4.5a) Provide details of your products and/or services that you classify as low-carbon products or that enable a third party to avoid GHG emissions.

**Level of aggregation**
Company-wide

**Description of product/Group of products**
Fuel-efficient tires: Tires that have reduced tire rolling resistance which influences vehicle fuel efficiency. A wide-ranging line-up is available, from passenger car tires to tires for trucks/buses, and the design facilitates rolling resistance in order to enhance fuel efficiency. Specifically, through the use of NanoPro-Tech which exercises control over the fine structure of materials, we are striving to reduce rolling resistance by reducing energy loss and controlling heat generation of tread rubber.

**Are these low-carbon product(s) or do they enable avoided emissions?**
Avoided emissions

**Taxonomy, project or methodology used to classify product(s) as low-carbon or to calculate avoided emissions**
Other, please specify (LCA method of the Japan)

**% revenue from low carbon product(s) in the reporting year**
71

**Comment**
CO2 reduction using fuel-efficient tires during the product use stage. Reasons for the possibility of reduction: Improvement of tire rolling efficiency can contribute to fuel efficiency improvement/CO2 reduction when customers use one's vehicles. Since the tire fuel efficiency or its standards differ by country, we approximate CO2 emissions. When we calculate based on "Tyre LCCO2 Calculation Guidelines" published by JATMA, due to reduction in tire rolling resistance, it contributed about 13,400,000 tons of CO2 reduction in 2018 compared with the products in 2005.

**Level of aggregation**
Group of products

**Description of product/Group of products**
Commercial roofing and building envelope solutions such as energy-saving polyiso insulations, roofing membranes, vegetative roofing solutions, airtight building envelope systems, etc. which qualify for Leadership in Energy and Environmental Design (LEED) credits and contribute to healthy, high-performance construction.

**Are these low-carbon product(s) or do they enable avoided emissions?**
Avoided emissions

**Taxonomy, project or methodology used to classify product(s) as low-carbon or to calculate avoided emissions**
Other, please specify (Leadership in Energy and Environmental Design (LEED))

**Leadership in Energy and Environmental Design (LEED)**

**% revenue from low carbon product(s) in the reporting year**
29

**Comment**
The percentage was estimated as the number of product line which contributes to “Energy & Atmosphere” category of the LEED rating system divided by total number of product line of our subsidiary - "Firestone Building Products". As in their latest sustainability report, 4 of 14 main product line contributes to the category. (12 of 14 contributes to at least one category.)

C6.4

(C6.4) Are there any sources (e.g. facilities, specific GHGs, activities, geographies, etc.) of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure?

Yes

C6.4a
Provide details of the sources of Scope 1 and Scope 2 emissions that are within your selected reporting boundary which are not included in your disclosure.

Source
GHGs except CO2

Relevance of Scope 1 emissions from this source
Emissions are not relevant

Relevance of location-based Scope 2 emissions from this source
Emissions are not relevant

Relevance of market-based Scope 2 emissions from this source (if applicable)
Emissions are not relevant

Explain why this source is excluded
At production sites in Japan and the Americas, GHGs except CO2 are collected but are excluded because emissions are minimal relative to CO2.

Source
Production sites with number of workers below 50 people and that is not the subject of accreditation of ISO14001

Relevance of Scope 1 emissions from this source
Emissions are not relevant

Relevance of location-based Scope 2 emissions from this source
Emissions are not relevant

Relevance of market-based Scope 2 emissions from this source (if applicable)
Emissions are not relevant

Explain why this source is excluded
The reasons why production sites with number of workers below 50 people and are not the subject of accreditation of ISO14001, are excluded is because their influence on the total is very limited.

Source
Office/storages etc., nonproduction sites (supplementary facilities of plants are excluded)

Relevance of Scope 1 emissions from this source
Emissions are not relevant

Relevance of location-based Scope 2 emissions from this source
Emissions are not relevant

Relevance of market-based Scope 2 emissions from this source (if applicable)
Emissions are not relevant

Explain why this source is excluded
Office energy is collected at major sites but excluded because emissions are minimal.

Source
Company owned car

Relevance of Scope 1 emissions from this source
Emissions are not relevant

Relevance of location-based Scope 2 emissions from this source
Emissions are not relevant

Relevance of market-based Scope 2 emissions from this source (if applicable)
Emissions are not relevant

Explain why this source is excluded
Refilling company owned cars outside the premises is excluded because their influence on the total is very limited. (Refilling fuel within the premises is included in Scopes)
C6.5

(C6.5) Account for your organization’s Scope 3 emissions, disclosing and explaining any exclusions.

Grid mix of renewable electricity

Low-carbon technology type
Other low-carbon technology, please specify (Breakdown of the source is unknown)

Region of consumption of low-carbon electricity, heat, steam or cooling
Other, please specify (All regions)

MWh consumed associated with low-carbon electricity, heat, steam or cooling
962740

Emission factor (in units of metric tons CO2e per MWh)
0.461469
Comment
As for purchased electricity without certificates, portion generated by renewable energy was calculated confirming renewable energy ratio with public data such as IEA, individual confirmation with suppliers etc. The Emission factor was calculated as below. 
Emission factor = Total CO2 emission by purchased electricity RE ratio of which is available(MWh) / (Low carbon electricity RE ratio of which is available(MWh) + Non-Low carbon electricity(MWh)) = 2186929/(962740+3776323)=0.461469

C11. Carbon pricing

C11.1

(C11.1) Are any of your operations or activities regulated by a carbon pricing system (i.e. ETS, Cap & Trade or Carbon Tax)?
Yes

C11.1a
Select the carbon pricing regulation(s) which impacts your operations.
EU ETS
Japan carbon tax

(C11.1b) Complete the following table for each of the emissions trading systems in which you participate.

EU ETS

% of Scope 1 emissions covered by the ETS
5.3

Period start date
January 1 2018

Period end date
December 31 2018

Allowances allocated
99328

Allowances purchased
3508

Verified emissions in metric tons CO2e
112288

Details of ownership
Facilities we own and operate

Comment

(C11.1c) Complete the following table for each of the tax systems in which you participate.

Japan carbon tax

Period start date
January 1 2018

Period end date
December 31 2018

% of emissions covered by tax
28.72

Total cost of tax paid
156493789

Comment
% of emission covered by tax was calculated by Scope1 emission in Japan divided by global Scope1 emission. And total cost of tax paid was calculated by Scope1 emission in Japan multiplied Japan Carbon tax rate(289yen/tCO2e) *In addition, the carbon tax is indirectly affect electricity price in the Scope 2.

(C11.1d)
What is your strategy for complying with the systems in which you participate or anticipate participating?

As our strategy for carbon pricing system, we intend to minimize additional cost by CO2 emission and such system by promoting CO2 emission reduction actively and steadily on global basis. Representative measures are as followings.

- Energy saving initiatives at production sites including active introduction of highly efficient equipment to new facility (e.g. As example in 2018, Bridgestone's Turkish affiliate, Brisa Bridgestone Sabancı Lastik Sanayi ve Ticaret A.Ş. (BRISA) established a new manufacturing facility for radial tires in Aksaray Province, Turkey with investment which amounted to 300 million USD. This new plant achieved 30% energy saving and contributes to our manufacturing with less CO2 emission.)

- Energy saving initiatives at business offices (e.g. turning off lights and air-controls when unnecessary)

- Enlightenment activities to raise employees' environmental awareness (e.g. continuing education not only by on-site training but also by utilizing e-leaning.)

Has your organization originated or purchased any project-based carbon credits within the reporting period?

No

Does your organization use an internal price on carbon?

Yes

Provide details of how your organization uses an internal price on carbon.

Objective for implementing an internal carbon price
Drive energy efficiency
Drive low-carbon investment

GHG Scope
Scope 1
Scope 2

Application
Applied to decisions of investment for equipment

Actual price(s) used (Currency / metric ton)
1989

Variance of price(s) used
If the actual price is available in each regional system, the price is applied preferentially. If not, the price above is utilized commonly inside company as a guide and reviewed once a year.

Type of internal carbon price
Shadow price

Impact & implication
Internal guidelines: Our Investment Profit Criteria stipulate consideration of carbon emission impacts (increase or reduction) of investments are to be integrated as cost when making judgments for strategic investment projects. The cost of emission impacts is to be calculated as the price of an emissions credit unit.
C12. Engagement

C12.1

(C12.1) Do you engage with your value chain on climate-related issues?
Yes, our suppliers
Yes, our customers
Yes, other partners in the value chain

C12.1a
(C12.1a) Provide details of your climate-related supplier engagement strategy.

**Type of engagement**
Engagement & incentivization (changing supplier behavior)

**Details of engagement**
- Included climate change in supplier selection / management mechanism
- Code of conduct featuring climate change KPIs
- Climate change is integrated into supplier evaluation processes
- Run an engagement campaign to educate suppliers about climate change

Other, please specify (Engaging suppliers to take the third party assessment on sustainability including environment/climate change related aspect)

% of suppliers by number
100

% total procurement spend (direct and indirect)
100

% Scope 3 emissions as reported in C6.5
6

**Rationale for the coverage of your engagement**
Coverage: In Feb.2018, Bridgestone issued the Global Sustainable Procurement Policy which is applicable to all purchased materials and services, as well as all suppliers globally. Rationale for the coverage: The journey towards “100% sustainable materials” which is one of the Bridgestone's goals for 2050 and beyond and includes aspect of mitigation of climate related impact, will not be simple, nor can Bridgestone achieve it alone. This policy is to help identify and evaluate qualified suppliers, promote best practices, and serve as a communication and improvement tool for the industry. Bridgestone expects all of its suppliers to recognize the importance of Sustainable Procurement, and work with the Company to implement appropriate practices to create value for all stakeholders. Note: During the development of the policy, Bridgestone gained insights from external stakeholders, including international consultants, non-governmental organizations (NGOs), materials suppliers, natural rubber farmers, and key customers to ensure the policy reflects industry standards and best practices. In addition, the policy is supported by a global implementation and communication plan. Available in 12 languages, the policy will be implemented, governed and enforced regionally. As an immediate first step, Bridgestone will prioritize working closely with its employees, suppliers and customers and other industry experts to implement the policy.

**Impact of engagement, including measures of success**
"The four major areas are impacted throughout Bridgestone’s supply chain: “Transparency”, “Compliance”, “QCD(Quality/Cost/Delivery) and Innovation”, “Sustainable Procurement Practices” incorporating environmentally responsible procurement including measures for climate change, reduction of GHG emission as well as the use of energy. Through a 2018 partnership with EcoVadis, a leading provider of sustainability, risk and performance ratings for global supply chains, Bridgestone conducted assessing suppliers’ current sustainability practices, as well as the possible support needed to improve performance. This activity could be an opportunity for suppliers to confirm and improve their actions for preventing climate change further. As an example of the indicator to confirm the progress, Bridgestone focuses on the ratio of acknowledgement of the policy by suppliers. As of March 2019, the ratio has been increased to 98 percent (more than 1,600) of the company’s Tier 1 tire material suppliers and the majority of them are in the process of completing third-party assessments with EcoVadis.

**Comment**

C12.1b
(C12.1b) Give details of your climate-related engagement strategy with your customers.

**Type of engagement**
Collaboration & innovation

**Details of engagement**
Run a campaign to encourage innovation to reduce climate change impacts

**% of customers by number**
100

**% Scope 3 emissions as reported in C6.5**
15

**Please explain the rationale for selecting this group of customers and scope of engagement**

i) In the development of new vehicle models by automakers, which are our business partners, the development and delivery of fuel-efficient tires that contribute to the reduction of fuel consumption in cooperation with automakers leads to the reduction of GHG emissions. In addition, we cooperate in calculating the emissions of automakers and contribute to reductions in the life cycle by cooperating in the GHG emission survey of automakers through the CDP supply chain program. Because we promote such activities with all automakers, 100% is input into "size of engagement" ii) By improving the rolling resistance of tires used in automobiles, we contribute to automakers’ efforts to lower fuel consumption during the use of their products.

**Impact of engagement, including measures of success**
Improvement of fuel efficiency of tires brings CO2 reduction from vehicles. The direct impact of the engagement is calculated by the result of tire units sold to the automakers multiplied by the average of CO2 emission per tire. And the technology which is developed by the engagement can be applied tires which are sold directly to end-users for their replacement needs. From this perspective, the engagement has further potential to contribute CO2 reduction. From this viewpoint, we keep going on improvement of fuel efficiency of tires with corporate-wide and mid-term target on 25% reduction of rolling resistance which affects fuel efficiency vs 2005 until 2020. The progress towards the target is the measure of success for Bridgestone. As of 2018, the Group achieved 21% reduction which is equivalent to 13,400,000t-CO2 of our Scope3(Category11) reduction from 2005.

(C12.1c)

**Give details of your climate-related engagement strategy with other partners in the value chain.**

On tire business, sales of fuel efficient tire are one of important activities to contribute to CO2 reduction. In addition, to enhance sales of such tires by telling their value to customers appropriately, it is necessary to cooperate with tire dealers as our important partners. Specifically, we as a tire manufacture, have been making effort to let fuel efficiency of tires visible both to the dealers and customers by supporting introduction of ECO labelling system as tire industry. Display on labels supported by such system is beneficial and helpful for dealers when they recommend fuel efficient tires to their customer and when customers make decision on their purchase. And, of course, we have been promoting enrichment of such tires in our product portfolio for actual benefit for both of them.

In case that we calculate under the condition of sold number of replacement tires listed in catalog for passenger cars in Japan, 57% of those sold tires are conformable to the environmental product declaration in accordance with external standard by Japan Automobile Tyre Manufacturers Association(JATMA). From climate-change perspective, coexistence of low rolling resistance which contributes low CO2 emission and other performances like WET performance which supports safety is key challenge for our tire development. Therefore, the number of our ECO products which achieves high quality in such areas in the same time is one of our measure of success.

As a case study, Bridgestone completed development of REGNO GR-XII in 2018 and launched in Feb. 2019 as a flagship of comfort tire. Because all sizes of this new product are labelled through the system above, satisfying the criteria, dealers and customers can easily recognize the product has high wet performance and low rolling resistance with other greatly balanced performance as the feature of the product.

(C12.3)
(C12.3) Do you engage in activities that could either directly or indirectly influence public policy on climate-related issues through any of the following?
Trade associations

C12.3b

(C12.3b) Are you on the board of any trade associations or do you provide funding beyond membership?
Yes

C12.3c
(C12.3c) Enter the details of those trade associations that are likely to take a position on climate change legislation.

Trade association
The Japan Rubber Manufacturers Association (JRMA)

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
After the commitment period of the Kyoto Protocol (since 2013), JRMA has been working consistently to achieve the goal of reducing CO2 in 2020 which has been set as a trade association’s target in line with the national policy calling for the ongoing reduction of CO2. In addition, JRMA set the target for 2030 also in 2015. Based on the targets of industry groups including JRMA, Japan’s reduction targets submitted to COP21 were drawn up. Every year, they give a follow-up report on the reduction status to the government and steadily promoted activities to reduce the emission. According to the follow-up report which they issued in October 2018, their CO2 emission intensity in 2017 has been improved and became 90.9% vs 2005.

How have you influenced, or are you attempting to influence their position?
At the Environmental Committee, Bridgestone leads industry activities and summarizes the opinions as the chairperson.

Trade association
The Japan Automobile Tyre Manufacturers Association, Inc. (JATMA)

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
JATMA is one of the major tire industry associations in the world, and has established the Tire Labelling System in 2010, and has been contributing to increasing the ratio of “Fuel Efficient Tires” in the market. (In the lifecycle of tire, CO2 emission in usage stage consists of more than 80%) In 2015, JATMA compiled and announced the benefits of CO2 emission reduction through reduced rolling resistance of passenger car tires from 2006 to 2012. In 2018, JATMA issued a report on the contribution of rolling resistance coefficient (RRC) of tires for CO2 reduction. According to the report, CO2 emission per tire has been reduced by 13.9% in 2016, compared to 2006.

How have you influenced, or are you attempting to influence their position?
Our employees have participated in various committees and presented our opinions. At the Environmental Committee, Bridgestone leads industry activities and summarizes the opinions as the chairperson.

Trade association
World Business Council for Sustainable Development (WBCSD)

Is your position on climate change consistent with theirs?
Consistent

Please explain the trade association’s position
Since 2006, the Tire Industry Project (TIP) under the umbrella of the World Business Council for Sustainable Development has served as a voluntary joint-initiative undertaken by 11 global leading tire manufacturers, under the leadership of the CEOs, with an aim to identify and address the potential human health and environmental impacts associated with tire development and use. TIP is a proactive organization that allows the industry’s leading companies to leverage their collective action in advancing sustainability throughout the industry. In 2018, TIP conducted research on 2017 result of environmental KPIs for tire manufacturing such as CO2 emission and energy consumption for issuance of a report in 2019.

How have you influenced, or are you attempting to influence their position?
As one of the co-chair companies of the Tire Industry Project, Bridgestone is engaged in the visualization of the overall impact of climate change through discussions with other companies.

C12.3f
What processes do you have in place to ensure that all of your direct and indirect activities that influence policy are consistent with your overall climate change strategy?

In order to ensure consistency, a special team of the Corporate Communication Division which belongs to Bridgestone's headquarters is in charge of communication and negotiation with external companies and organizations, uniformly handles cooperation with industry groups. Important discussions with industry groups are reported to the Global Environment Working Group and the Global CSR Enhancement Committee (GCEC), for review and to ensure consistency and representatives of Bridgestone’s feedback into industry groups.

C12.4
